Why capacity planning?

Hot eBusiness News

Poor Web Site Performance Is Costing Retailers Millions

Assignment Project Exam Help

- The aim of capacity planning is to ensure the performance of computer systems is maintained over time. <https://eduassistpro.github.io/>
- What is performance?
- What is capacity?

Add WeChat edu_assist_pro

Design of an e-Commerce systems

- Functional requirements
 - Product search, database management functions etc
 - Search correctness, algorithmic efficiency
 - Computer and network security
 - System performance
 - E.g. Can the co base search within 20ms if there are 500 sea
 - If not, should w ny?
- Workload
- capacity
- performance
- Assignment Project Exam Help
- <https://eduassistpro.github.io/>
- Add WeChat edu_assist_pro
- Can you think of other system performance requirements?

Web search engine

- Say you are planning a computer system which will host a search engine that rivals Google
- Current expected workload
 - 1000 searches per second
- Performance specification
 - Return results with <https://eduassistpro.github.io/> performance
- What hardware and network should we use?
 - How many servers? How much capacity Etc.
- What if workload is expected to increase by 50% in one year, can the system still maintain its performance?
- Question: Can you think of other capacity parameters?

Capacity planning problems

- Focused on capacity planning of computer systems and networks
- Elements of a capacity planning problems
 - Given:
 - Workload specifications
 - Performance s
 - Find:
 - Capacity e.g. hardware or network resources, personnel requirements etc.
- Capacity planning problems are everywhere in life. Can you come out with some capacity planning problems in real life? For each problem, you must identify the workload, performance and capacity parameters.

Capacity planning motivations

- Importance of performance
 - Can be life and death
 - *Availability* of critical infrastructure e.g. emergency services
 - Customer satisfaction
 - *Availability*
 - *Response time*
- The italicised term *computer system related performance metrics*
 - Also known as Quality of service

ics

Response time

- Response time
 - What is it? (Next slide)
 - Possible performance specifications
 - Mean response time is less than 1 s when no more than 5000 requests arrive per second
 - 95% of the requests are within 1s when no more than 5000 requests arrive per second
 - Note: Workload characterisation is part of the performance specification

Assignment Project Exam Help

Response time of a system

Request arrives
at time t_1

Assignment Project Exam Help

Request
completes
and leaves
at time t_2

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Response time = $t_2 - t_1$.

Measured in seconds. Can be expressed as mean, standard deviation, probability distribution etc.

Availability

- Fraction of time the system is up and useable by users
 - Ex: It is common for Internet Service Providers (ISP) to sign Service Level Agreement (SLA) with their commercial customers. One ISP guarantees that its network outage is less than 6 hours per 30 days. The network availability is $1 - 6/(30 \times 24) = 99.17\%$

Capacity Planning → Performance analysis

- Capacity planning question:
 - A web server needs to complete an HTTP request within 20ms when there are 500 HTTP requests per second, what CPU speed do you need?
- Let us turn the capacity planning question into a performance analysis question
<https://eduassistpro.github.io/>
- Performance analysis question
[Add WeChat edu_assist_pro](#)
 - If the web server has a CPU with x GHz, what is the response time when there are 500 HTTP requests per second?
- If you can solve the performance analysis question for any value of x , you can also solve the capacity planning question

Exercise:

- As a capacity planner, your task is to choose the CPU speed (in MIPS) of a web server so that the mean response time to a specific workload is no more than 25ms.
- You talk to a performance analyst about your problem. The analyst knows an algorithm that predicts the mean response time for any CPU speed.
- You take the algorithm and run it for different CPU speeds. The results are recorded in the table below.
- Can you solve your capacity planning problem?

CPU Speed (MIPS)	Predicted mean response time (ms)
2000	40
2500	32
3000	26
3500	22
4000	18

Three performance analysis strategies

- Build the system and perform measurement
- Simulation
- Mathematical modelling

- This course will look at
 - Quantitative metrics of computer systems using
 - Queueing networks
 - Markov chains
 - Using simulation to study performance
 - Optimisation methods such as linear and integer programming

Assignment Project Exam Help

Add WeChat edu_assist_pro

Ex. 1: Server farm power allocation

- A server farm consists of multiple servers
- The servers can run at
 - Higher clock speed with higher power
 - Lower clock speed with lower power
- Ex: Given
 - Higher power = 250W, lower power = 150W
 - Power budget
 - You can have
 - 12 servers at highest clock sp
 - 20 servers at lowest clock speed
 - Other combinations
 - Which combination is best?
- Queueing theory

Ex 2: Internet data centre availability

- Distributed data centres
- Availability problem:
 - Each data centre may go down
 - Mean time between going down is 90 days
 - Mean repair time is 6 hours
 - Can I maintain 3 out of 4 centres
- Technique: Markov

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Ex 3: Network expansion

- You would like to add communication links to a network. The design questions are: Where to add? How much capacity?
- Technique: Integer programming

Assignment Project Exam Help

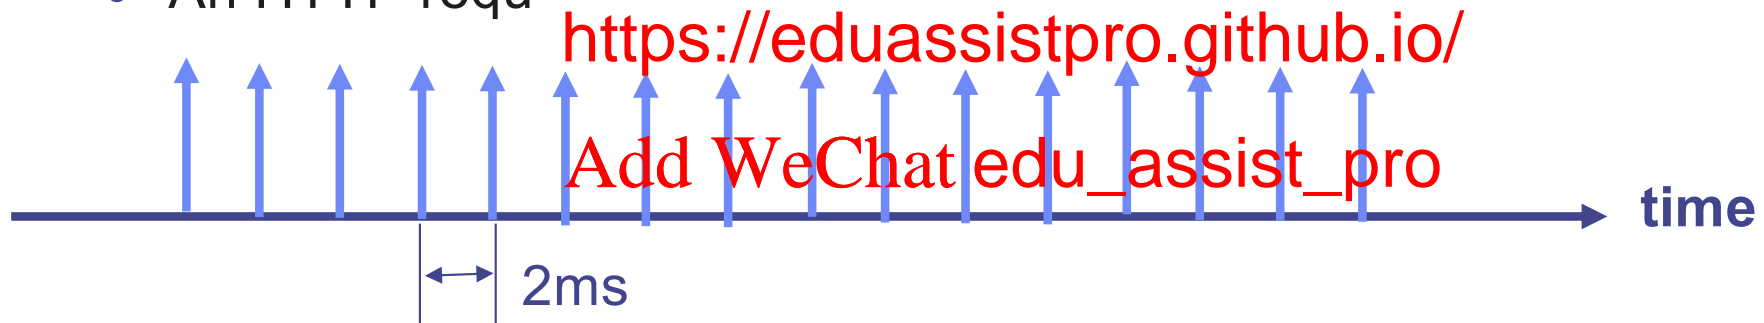

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Why probability?

- The mathematical methods that we are going to study are based on probability theory. Why probability?
- Let us say 500 HTTP requests arrive at the web server in one second
- A deterministic world will mean

- An HTTP request

- But the arrival pattern is not deterministic, it's random

Lecture outline

- Capacity planning
 - Why?
 - What?

QoS metrics

- We have seen 2 QoS metrics
 - Response time
 - Availability

- More QoS metrics

- Throughput
- Reliability (Will e)
- Scalability (Not

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Throughput (1)

- The rate at which requests are completed
- Ex: For network routers, throughput can be measured in
 - Packets per second (pps)
 - Ex: 10 Mpps for 40-byte packets
 - Note: Should specify packet size
 - Mb/s
- Other throughput
 - Web site: HTTP requests/s, by
 - CPU: MIPS, FLOPS

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Throughput (2)

- Throughput is a function of the load
 - A disk takes 0.01s to perform an I/O operation
 - Maximum number of I/O operation per s =
 - If 50 I/O operations arrive per second, the throughput = I/O operations/s
 - If 110 I/O operations arrive per second, the throughput = I/O operations/s
- Can you find a formula relating throughput to offered load and max capacity?
-

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Throughput (2*)

- If you find it difficult to do the previous page, you can try this real-life analogy.
- Throughput is a function of the load
 - A barister can make a cup of coffee every 30 seconds
 - Maximum number of cups of coffee the barister can make in an hour =
 - If 50 customers a stomer orders a coffee, the barister's throughput = / hour
 - If 150 customers arrive in an hour stomer orders a coffee, the barister's throughput = coffees / hour

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Thrashing = congestion collapse

Throughput (4)

- Performance evaluation can be used to determine the maximum throughput of computer systems
 - Example: bottleneck analysis
 - Topic for next week

Quantitative performance analysis (3)

- Sample performance analysis question:
 - If the web server has a CPU with x MIPS, what is the response time when there are 500 HTTP requests per second?
- Performance analysis question:
 - Given:
 - A computer s
 - The workload
 - Find
 - The performance (response time, t) of the system
- Our method is:
 - Build analytical models of computer systems
- An important part of the analytical model is “queue”
 - You can surely relate “queues” to “waiting time”

Add WeChat edu_assist_pro

Single server FIFO queue

- Queueing Theory terminologies
 - Server: Processing unit
 - FIFO: First-in first-out
 - Work conserving server
 - The server cannot be idle when there are jobs waiting to be processed in the queue
- Ex: Shop with only <https://eduassistpro.github.io/>
- The server is a resource
 - Queues result from resource cont
- Main concern: response time

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4	9	3

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Assumption: server is idle when jobs arrive
Add WeChat edu_assist_pro

Job #1 is admitted into the server immediately since the server is idle.

Job #1 is completed and leaves the system at time 4.

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4	9	3

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Job #2 arrives when the server is idle. It gets admitted immediately.

Job #2 will be completed at time 10.

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4	9	3

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Job #3 arrives when Job #2 is being served i.e. the server is busy. Job #3 has to wait in the queue. Server starts processing Job #3 immediately after finishing Job #2.

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4	9	3

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Job #4 arrives when the server is processing Job#2 and Job#3 is in the queue. Job #4 joins the queue. It gets served at time 14, immediately after Job#3 is completed.

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4	9	3

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- Definition: **Response time** = Departure time - arrival time
 Ex: Response time for Job#4 = $17 - 9 = 8$ (= 5 + 3)
- Response time = **Waiting time** + Processing time

Job index	Arrival time	Processing time required
1	2	2
2	6	4
3	8	4
4		

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- Definition: **Utilisation** = Percentage of time over which the server is busy
- What is the utilisation of the server over the first 12s?
 - $8/12 = 66.7\%$

Single server FIFO queues

- Can be used to model
 - Shop with only one checkout counter
 - A single processor processing jobs in FIFO order
 - A disk processing job in FIFO order
 - Model
 - An abstraction of
 - Need to capture
- Assignment Project Exam Help**
- <https://eduassistpro.github.io/>
- Add WeChat edu_assist_pro**
- analysis requirements

What if both inter-arrival time and processing time are deterministic?

Job index	Arrival time	Processing time required
1	2	1
2	4	1
3		
4		

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

What is the waiting time for each job?
What is the response time for each job?

Determining response time

- Generally we need to know
 - The arrival pattern
 - Ex: The arrival rate
 - Ex: The inter-arrival time probability distribution
 - The service time probability distribution
 - The time required
- Since we are interested in capturing the time related aspects of real systems e.g. queueing, processing units, our models
- We will learn different methods to determine response time in this course

Service time

- Time require to process a request at a resource
 - Ex: The service time to send a 1000 byte packet over a 10 kbps link is 0.8s. In this case,
 - Service time = packet size / transmission rate
 - Ex: The service time to fetch a X byte large file from a disk is
 - Seek time + X / transfer rate
 - For a class of re <https://eduassistpro.github.io/>
 - Service time = Overhead + Job ing rate
- Assignment Project Exam Help
- Add WeChat edu_assist_pro

Summary

- What capacity planning is
- Very important: A capacity planning problem can be solved by solving a series of performance analysis problems

Assignment Project Exam Help

- Performance metrics
 - Response time, waiting time, t
- Modelling of single server queues
