# COMP9334 Capacity Planning for Computer Systems and Networks

Assignment Project Exam Help

Week 5Bhttps://eduassistpro.gistimbulla/tion (4): Generating\_randemat\_edu\_assist\_pro

COMP9334

#### This lecture

- Discrete event simulation
  - Week 4B: How to structure the simulation
  - Weeks 5A, 5B 1: Statistical analysis
- This lecture Assignment Project Exam Help
  - https://eduassistpro.github.io/probability distribution Background on
  - How to genera
  - Reproducibility Add WeChat edu\_assist\_pro
- Motivation

 The Python random library can generate random numbers from many probability distributions but sometimes you may need a distribution that the library does not have

**COMP9334** T1,2021

## Random number generator in C

- In C, the function rand() generates random integers between 0 and RAND\_MAX
- E.g. The following program generates 10 random integers:

```
#include <stdio.h>
#include <stdlib.hAssignment Project Exam Help
                     https://eduassistpro.github.jo/
and see
int main ()
                     Add WeChat edu_assiststphuted
 int i;
 for (i = 0; i < 10; i++)
  printf("%d\n",rand());
 return;
                            This C file "genrand1.c" is available
                            from the course web site.
```

## Distribution of 10000 entries from rand()

#### Sort into 50 bins

If the numbers are really uniformly distributed, we expect 200 numbers in each bin.

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu\_assist\_pro

The numbers are almost uniformly distributed

T1,2021 COMP9334

#### LCG

- The random number generator in C is a Linear Congruential Generator (LCG)
- LCG generates a sequence of integers  $\{Z_1, Z_2, Z_3, ...\}$  according to the recursion

$$Z_k = a Z_{k-1} + c \pmod{m}$$
  
where  $a$ ,  $c$  and Assignments Project Exam Help

- By choosing a, c, seemingly random i https://eduassistpro.github.io/
- If a = 3, c = 0, m = 5 A at twee first edu\_assiste puence 1, 3, 4, 2, 1, 3, 4, 2, ...
- Fact: The sequence generated by LCG has a cycle of m-1
- We must choose m to be a large integer
  - For C,  $m = 2^{31}$
- The proper name for the numbers generated is pseudo-random numbers

#### Seed

 LCG generates a sequence of integers {Z<sub>1</sub>, Z<sub>2</sub>, Z<sub>3</sub>, ...} according to the recursion

$$Z_k = a Z_{k-1} + c \pmod{m}$$

where a, c and m are integers

- The term Z₁ is call a seed
- By default, C also uses T as the seed and it will generate the same random sequence

  | Assignment Project Exam Help | Pro
- https://eduassistpro.github.io/

  fferent random

  sequences and you pand the edu\_assisting the function srand()

  before using rand()
  - Demo genrand1.c, genrand2.c and genrand3.m
  - genrand1.c uses the default seed
  - genrand2.c sets the seed using command line argument
  - genrand3.c sets the seed using current time

## Uniformly distributed random numbers between (0,1)

- With rand() in C, you can generate uniformly distributed random numbers in between 1 and 2<sup>31</sup>-1(= RAND\_MAX)
  - By dividing the numbers by RAND\_MAX, you get randomly distributed numbers in (0,1)
- - Both libraries use "https://cddassistpro-9ldom number generator with a period of 2<sup>19937</sup>-1 WeChat edu\_assist\_pro
    If you use 10<sup>9</sup> random number in a sequence will only
  - If you use 10<sup>9</sup> random number in a sequence will only repeat after 10<sup>5985</sup> years
- Why are uniformly distributed random numbers important?
  - If you can generate uniformly distributed random numbers between (0,1), you can generate random numbers for any probability distribution

## Random numbers generated by numpy

- 10,000 numbers generated by numpy.random.random()
  - Code in rand\_uni.py

#### Fair coin distribution

- You can generate random numbers between 0 and 1
- You want to use these random numbers to imitate fair coin tossing, i.e.
  - Probability of HEAD = 0.5
  - Probability Ant Table Project Exam Help
- You can do this
   Generate a ran https://eduassistpro.github.io/
  - If u < \_\_\_\_, outputAtteAWeChat edu\_assist\_pro
  - If u ≥ , output TAIL

#### A loaded die

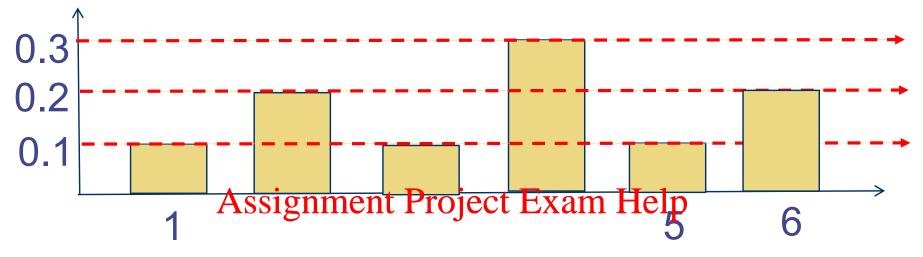

You want to create a loaded die with probability mass function

- The algorithm is:
  - Generate a random number u

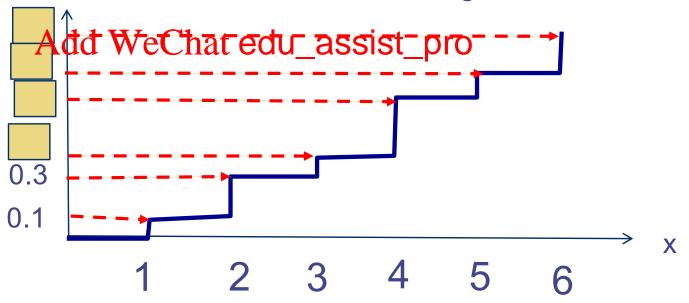

T1,2021

## Cumulative probability distribution

https://eduassistpro.githuleeig/ves a value ≤ x

Ex: Can you work out what these levels should be

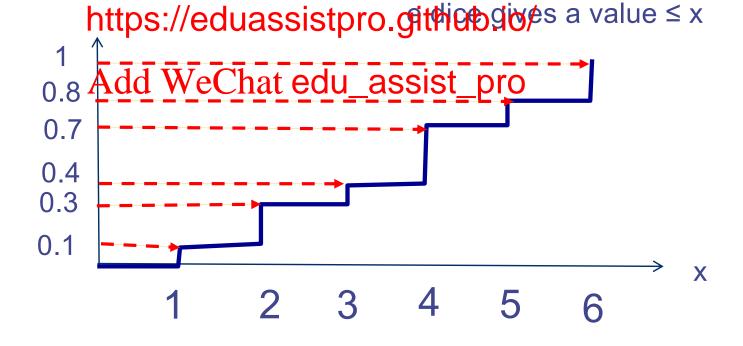

## Comparing algorithm with cumulative distribution

- The algorithm is:
  - Generate a random number u
  - u < 0.1, output 1
  - If  $0.1 \le u < 0.3$ , output 2

  - If 0.3 ≤ u < 0.4. soignment Project Examo Help
- If  $0.4 \le u < 0.7$ , output 4
- If  $0.7 \le u < 0.8$ , output 5
  - , output 6

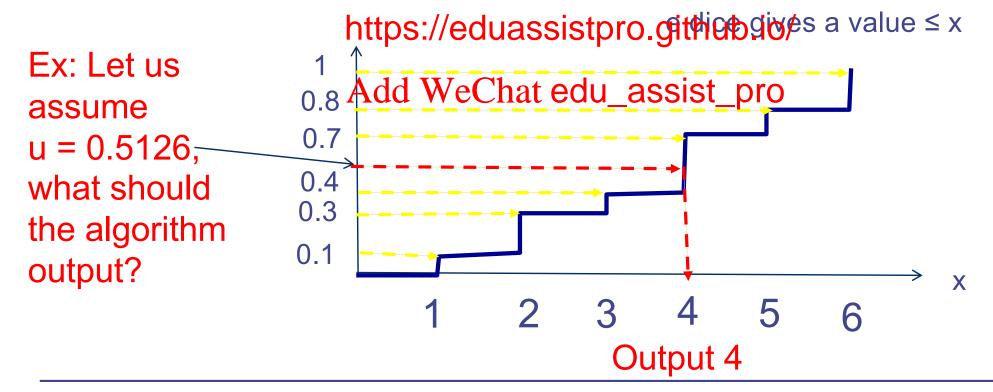

Ex: What do you notice about the intervals in the algorithm and the cumulative distribution?

T1,2021 12 **COMP9334** 

## Graphical interpretation of the algorithm

- The algorithm is:
  - Generate a random number u
  - u < 0.1, output 1
  - If  $0.1 \le u < 0.3$ , output 2
- If  $0.4 \le u < 0.7$ , output 4
- If  $0.7 \le u < 0.8$ , output 5
  - If 0.3 ≤ u < 0.4. ssignment Project Examo Help , output 6

T1,2021 13 **COMP9334** 

#### Graphical representation of inverse transform method

 Consider the cumulative density function (CDF) y = F(x), showed in the figure below

For this particular F(x), if u = 0.7 is generated then  $F^{-1}(0.7)$  is 6.8

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu\_assist\_pro

#### Inverse transform method

- A method to generate random number from a particular distribution is the inverse transform method
- In general, if you want to generate random numbers with cumulative density function (CDF)  $F(x) = Prob[X \le x]$ , you can use the following procedure: Assignment Project Exam Help
  - Generate a nu distributed in (0,1)
  - Compute the n https://eduassistpro.github.io/

#### Add WeChat edu\_assist\_pro

- Example: Let us apply the inverse transform method to the exponential distribution
  - CDF is 1 exp(- λx)

#### Generating exponential distribution

- Given a sequence {U<sub>1</sub>, U<sub>2</sub>, U<sub>3</sub>, ...} which is uniformly distributed in (0,1)
- The sequence  $\log(1 U_k)/\lambda$  is exponentially distributed with rate  $\lambda$
- (Python file hist\_expon.py)
- 1. Generate 10,000 uniformly distributed numbers in spannent Project Exam Help
- 2. Compute -log(1-u<sub>k</sub>)/2 wh u<sub>k</sub> are the numbers generated in Step 1 https://eduassistpro.github.io/
- 3. The plot shows Add WeChat edu\_assist\_pro
  - The histogram of the numbers generated in Step 2 in 50 bins
  - The red line show the expected number of exponential distributed numbers in each bin

## Reproducible simulation – motivation

- You may recall that when we run the simulation sim\_mm1.py, each simulation run gives a different result because different set of random numbers is used
- Doing simulation is like performing a scientific experiment
- Good science de https://eduassistpro.github.io/
  - E.g., If you claim that the contact edu\_assistof produce your result say 1.3579, other people should produce your result

## Reproducible simulation

- In order to realise reproducibility of results, you need to save the state of the random number generator before simulation If you reuse the setting later, you can reproduce the result
  - The state of the Mersenne Twister plays a similar role to a seed in the generator used by C Assignment Project Exam Help
- Demo: sim\_mm1.

https://eduassistpro.github.io/

```
# obtain setting and save it in a file WeChat edu_assist_pro rand_state = random.getstate()
pickle.dump( rand_state, open( "rand_state_mm1.p", "wb" ) )
```

```
# load the saved setting and apply it
rand_state = pickle.load( open( "rand_state_mm1.p", "rb" ) )
random.setstate(rand_state)
```

## Random number generators in Python

- Although both the random and numpy.random libraries use the Mersenne Twister generator, the generator for the libraries are separate
- The numpy.randgmitaraPyroject Exam Help
  - You can gener
     The functions t

    https://eduassistpro.github.io/
  - The functions t "the state and edu\_assist pro-state()

    numpy.random.get\_state() and edu\_assist pro-state()
  - Fewer distributions compared t

## Summary

- Basic concepts on pseudo-random number generators
- Using the inverse transform method to produce random numbers of different probability distributions
- Reproducibility why and how Assignment Project Exam Help
